Peeragogy on Music

From a 2013–2016 Concept to a Civic Music Learning Point

Fabrizio Terzi

Pyragogy / Peeragogia

Draft — October 14, 2026

Abstract

This document traces the arc of *Il Portale*, a concept for a civic music learning point first proposed between 2013 and 2016 as a submission to the Free Technology Guild journal. The original proposal combined a physical drop-shaped audio—visual structure, a digital keyboard, an OLED display, and networked learning resources into a single accessible station for music education. The present work reconstructs the historical concept, situates it within the peeragogical framework that informed its design, and documents the ongoing exploration of the Tea Pavilion in Parco Caprotti, Bergamo, as a candidate physical host. No experimental results are reported; this is a position and research-through-design document written to scaffold collaborative development and critical review.

1 Origins of the Project

The original concept for *Il Portale* was filed in January 2013 as a design specification under the name of Fabrizio Terzi and submitted to the Free Technology Guild (FTG) journal *Peeragogy in Action* in January 2016 [1]. The 2016 submission (Volume XII, No. 1) describes the project as a "model of use" combining music education, peeragogical methodology, and digital media within a compact physical structure.

The 2013 filing identifies the location already as "Parco Comunale dei Caprotti, Bergamo, Via Tasso"—the same park that anchors the present-day spatial exploration (see the project dossier in `docs/caprotti/`).

The original document is not a formal academic paper but a project proposal cast in the FTG format: a "seed project" description with technical drawings, a component breakdown, and a status section that frames the venture as a working group within the FTG. The abstract of the 2016 journal issue contextualises the submission inside the broader peeragogical discourse, describing the journal as an open editorial space for contributions on co-generation, recursion theory, and systems thinking in learning.

Status of the source. The 2016 PDF is the only known published version of the original proposal. No subsequent revision, peer review, or rejection record has been located. The present document treats it as a historical artefact: it is not corrected, rewritten, or reinterpreted freely. Where the contemporary work extends beyond the 2016 record, the distinction is made explicit.

2 The Original Concept

The 2013–2016 proposal describes a self-contained music-learning station whose physical design and digital infrastructure work as one system. The following summary is drawn exclusively from the historical document [1]; no contemporary reinterpretation is added here.

Physical structure

The station is built around a drop-shaped enclosure housing the audio diffusion system (Dolby Stereo Spectral Recording). A digital keyboard with MIDI input/output is the primary interaction device; during idle periods the keyboard folds into a shelf, turning the station into an architectural ornamental piece. A foot pedal system provides sustain, soft, and resonance control. An OLED (or equivalent) screen serves as the visual interface, switchable to a photo or video gallery when the station is not used for music.

Digital infrastructure

A central computing unit handles audio processing, MIDI sequencing, video playback, and web connectivity. A webcam enables video transmission to remote displays, supporting distance learning and remote performance. The system is designed to stream and reproduce audio–video concurrently, allowing the performer to experience simultaneous sensory stimulation.

Educational model

The proposal frames the station as an Open Educational Resource (OER) delivery point: tutorial videos, music lessons, and a tutoring marketplace are accessible through the unit. The pedagogical backbone is peeragogical—a collaborative, co-generated learning model documented in the companion text *The Peeragogy V3.3* and at peeragogy.org. The intention is not to replace a teacher but to create a low-friction access point for self-directed musical exploration.

Context of the submission

The document is filed as an invention disclosure—"a certain new and useful Improvement in a Music Education field"—and is cast in the Free Technology Guild seed-project format. No explicit open-source or open-content license is stated in the text. The FTG context and the reference to *Peeragogy.org* suggest an intention to share the concept within a collaborative community, but the original filing also names an inventor and an application number, indicating a hybrid disclosure–sharing intent.

3 The Learning City Point

The 2016 FTG submission introduces the concept of a "Learning City Point" as a one-line summary of the project's value proposition:

> We'll create opportunities for participants to learn music modules in a peeragogical style.

The phrase is placed under the heading "What is the proposed solution?" and is signed as a statement of intent. No further elaboration of the Learning City Point concept appears in the 2016 document. The term is not defined, nor is it linked to an existing body of literature in that document.

The present work interprets the Learning City Point as a minimal civic infrastructure node: a publicly accessible station that lowers the barrier to music learning by combining physical access (a keyboard, screen, and audio system) with digital access (OER, tutoring marketplace, peer community). This interpretation is marked as a contemporary development, not as a restatement of the 2013–2016 source.

Relationship to the broader peeragogy framework. The source cites *The Peeragogy V3.3* and references the peeragogy.org community. The Learning City Point can therefore be read as an applied instantiation of peeragogical principles—co-learning, co-generation, recursive practice—in a specific physical setting. The present document does not yet develop this into a theory; that work is reserved for a later stage of the editorial process.

4 Contemporary Spatial Exploration: Parco Caprotti

The ongoing project phase explores the Tea Pavilion (Padiglione del Tè) in Parco Caprotti, Bergamo, as a candidate physical host for the Civic Music Learning Point. This exploration is documented separately in the project's research dossier:

https://github.com/Peeragogia/ilportale/tree/main/docs/caprotti/

The dossier contains the evidence-based reconstruction of the pavilion's architecture, a proportional Blender blockout, verification renders, and a quality review. The building is a small glazed neo-Renaissance pavilion (c. 1890–1891), embedded in a romantic English-style garden with a pond, grotto, statues, and mature vegetation.

The pavilion was chosen because:

- The 2013 filing already identified Parco Caprotti as the intended location (section 1).
- The building is architecturally transparent, historically small, and has documented recent cultural reuse (Contemporary Locus 15, 2023).
- It offers a visible but contained intervention scale, appropriate for a prototype of a civic music learning point.

The architectural description of the pavilion is not repeated here; the dossier is the authoritative reference. Any integration of the pavilion's geometry, visual analysis, or measurement data into this publication will be added in a later revision, after field verification.

5 Future Work

The following directions are identified for the next stages of this project. None are executed yet; they are listed here to frame the editorial roadmap.

Blender reconstruction and spatial design. A proportional blockout of the Tea Pavilion exists (Blender 5.2, 215 objects, 5 cameras). The next step is to fix the interior lighting, pass the quality gate (80/100), and test three placement hypotheses for Il Portale inside the pavilion. The Blender workflow is non-destructive and versioned.

Learning experience design. The physical interaction model—seated versus standing, one-user versus multi-user, headphones versus open audio, screen visibility from outside—is unresolved. Each choice affects the spatial arrangement and the perceived relationship between historical architecture and contemporary intervention.

Evaluation. No user testing or formal evaluation has been conducted. Criteria for evaluating the prototype (usability, accessibility, learning outcomes, civic fit) are not yet defined.

Publication and peer review. This document is a scaffold. The next editorial cycle will involve collaborative revision with ChatGPT and critical review by Fabrizio Terzi before any public release.

Open questions.

- Exact external dimensions of the pavilion (field measurement pending).
- Interior ceiling height, floor build-up, wall construction.
- Conservation constraints for fixing equipment to historic surfaces.
- Feasibility of a permanent installation versus a periodic/temporary setup.
- Integration with existing park infrastructure (power, network, accessibility).
